Area 6 - Oneida Sandy Plains - Forest Production

C48 Stand 8 (5 Acres) and C49 Stand 5 (13 Acres) are comprised of well stocked red pine poletimber and sawtimber. These stands originated in 1956 and were previously thinned twice before. These stands will be thinned again to improve health and growth rates of remaining crop trees.

C50 Stand 2 (37 Acres) This stand originated in 1941. This small sawlog red pine stand is currently well stocked however there is some variability in the stocking. The stand had been thinned twice before and it will receive another improvement thinning to maintain the growth and vigor.

C50 Stand 7 (19 Acres) is comprised of well stocked red pine small sawtimber over red pine poletimber. This stand is somewhat clumpy and variable in stocking with some areas needing thinning more than others. Since other adjacent stands are being managed at this time it would be practical to conduct an improvement thinning concurrently with this stand to maintain stand health and vigor.

Aesthetics will be maintained in the area as a large number of residual red pine will be maintained following the harvest.
